

Junior QA engineer (50%)

Company Overview

Third-party companies are often the most vulnerable link in an organization security chain and almost always the least controlled one. Instead of targeting large websites directly, various attacks have shown how effective it is to target vulnerabilities in third-party companies. We constantly see that using third-party companies as the attack vector is on the rise, expecting to keep growing.

In an industry focused on detection, Source Defense provides websites with the first ever **prevention** technology for attacks of third-party origin. We are the first ever SAAS platform that allows a site owner to set and enforce permissions, receive real time alerts and monitor third-party vendors' behaviour on their site. By removing the security considerations from third-party integrations, we can save countless man-hours spent on tests and integrations, allowing sites to focus on generating revenues and new opportunities while keeping the site visitors safe and the site in high performance. More details will be provided to applicants during the interview

Job Description

Running manual tests on a web application, writing and following test scenarios and sanity tests. Working closely with R&D and product teams.

Responsibilities

- Identifying issues and weakness points of the system, reporting and tracking them in bug management systems.
- Writing testing scenarios and sanity tests
